

## **Rek-o-Kut Phono Cartridge Alignment Setup Protractor**

Determine which size records will be played most. Place the gauge on the turntable with the hole over the spindle. Place the arm end with the cartridge on the gauge and use the two selected diameter locations. With the stylus point at the designated dot on the gauge, and with the cartridge mounting screws slightly loosened, reposition the cartridge body such that it is as parallel as you can make it to the lines on the gauge, i.e. tangent to the record's radius. You can also twist the body side to side. Check at both minimum and maximum record diameters that you will be using most. This is always a compromise. Then tighten the cartridge mounting screws.

Suggestion: Start with the cartridge in the middle and straight. See what it takes at both radii extremes. Then try to figure out what an in-between orientation would be and adjust its position for that.
